

**CLAIM SET AS AMENDED**

1. (Currently Amended) A back light unit in a liquid crystal display including a lamp generating a light, and a light input having a lamp housing for housing the lamp secured therein by packing and for reflecting the light, said unit comprising:

a light-guide plate including a cone pattern to uniformly guide the light from the light input;

a light-path converter to control a progress direction of the light in such a manner that the light outputted from the light-guide plate is progressed in a direction perpendicular to a liquid crystal panel; and

a diffusion sheet for diffusing the light passing through the light-path converter into the liquid crystal panel,

wherein the cone pattern is formed on an upper surface of the light-guide plate, ~~and~~ a density of cones increases as a distance from said lamp increases[.], and the cones are more densely packed in partially dark areas in the light-guide plate caused by the packing.

2. (Cancelled)

3. (Previously Presented) The back light unit according to claim 1, wherein a vertical angle of a cone of the cone pattern ranges from about 30° to about 120°.

4. (Previously Presented) The back light unit according to claim 1, wherein a diameter of a cone of the cone pattern ranges from about 100 to about 500  $\mu\text{m}$  and a height ranges from about 50 to about 900  $\mu\text{m}$ .

5. (Previously Presented) The back light unit according to claim 1, wherein spacings of cones of the cone pattern is controlled to correspond to a distribution of the light.

6. (Original) The back light unit according to claim 1, wherein the light converter is a forward prism sheet having a vertical angle ranging from about 90° to about 130°.

7. (Original) The back light unit according to claim 1, wherein the light converter is a backward prism sheet having a desired between angle.

8. (Original) The back light unit according to claims 7, wherein a vertical angle of the backward prism is above about 100°.

9. (Original) The back light unit according to claim 1, wherein the light-path converter is a hologram sheet.

10. (Original) The back light unit according to claim 9, wherein a space and a shape of the hologram pattern are controlled to correspond to an output angle of the light progressing into the liquid crystal panel.

11. (Currently Amended) A back light unit for a liquid crystal display, comprising:

a lamp secured in a lamp housing by packing;

a light-guide plate aside said lamp and said lamp housing, said light-guide plate including cones distributed in a pattern for guiding uniformly light from the lamp, the packing resulting in partially dark areas in the light-guide plate;

a reflective plate placed below said light-guide plate; and

a diffusion sheet disposed above said light-guide plate,

wherein said cones are formed on an upper surface of said light-guide plate, ~~and~~ a density of cones increases as a distance from said lamp increases[[.]], and the cones are more densely packed in the partially dark areas.

12. (Original) The back light unit of claim 11, further comprising:

a light-path converter placed above said light-guide plate.

13. (Original) The back light unit of claim 12, wherein said light-path converter is one of a forward prism sheet, a backward prism sheet, and a hologram sheet.

14. (Original) The back light unit of claim 13, wherein said forward prism sheet has a prism with vertical angle ranging from about  $90^{\circ}$  to about  $130^{\circ}$ .

15. (Original) The back light unit of claim 13, wherein said backward prism sheet has a prism with a between angle of within  $45^{\circ}$ .

16. (Original) The back light unit of claim 13, wherein said backward prism sheet has a prism with a vertical angle of above about  $100^{\circ}$ .

17. (Previously Presented) The back light unit of claim 13, wherein said hologram sheet has a pattern and a shape that are controlled to correspond to an output angle of light exiting from said light-guide plate.

18. (Cancelled)

19. (Previously Presented) The back light unit of claim 11, wherein a density of said cones are such that said light exiting from said light-guide plate is uniformly distributed.

20. (Cancelled)

21. (Previously Presented) The back light unit of claim 19, wherein said cones are more densely populated around partially dark areas of said light-guide plate.

22. (Cancelled)

23. (Cancelled)

24. (Previously Presented) The back light unit according to claim 1, wherein an output angle  $\theta$  of light exiting from the light-guide plate is about 35°.

25. (Previously Presented) The back light unit of claim 11, wherein an output angle  $\theta$  of light exiting from the light-guide plate is about 35°.
